**Abstract.** *Scaphosepalum ziegleri*ae is described from a small area near Chical in northern Ecuador. It is distinguished by the large plant, waxy yellow flowers densely spotted with brown red to blood-red, spiky tails of the lateral sepals and a dark blood-red, wingless lip. It is here compared to *Scaphosepalum beluosum* with which it shares most similarities, and to *S. fimbriatum*, another species with fimbriated sepaline tails.

**Key words:** Ecuador, new species, osmophores, *Scaphosepalum beluosum*, *S. fimbriatum*, *S. ziegleri*

**Introduction.** *Scaphosepalum* Pfitz. is a genus in the subtribe Pleurothallidinae with up to 52 species generally accepted (Pridgeon 2005, Endara et al. 2011, Chase et al. 2015, Karremans 2016, Karremans et al. 2016). After Luer (1988), who recognized three sections and 30 species in his monograph, several new species have been described in the last twenty-five years (Luer 1991, 1992, 1997, 1998a, b, 2000, 2002, 2009, Valenzuela Gamarra 2015). The characteristic features of the genus are the osmophores at the base of the sepals and the non-resupinate flowers (Luer 1988, Pridgeon et al. 2005, Endara et al. 2011, Karremans et al. 2016). The peak of diversity of the genus is in the northern Andes, between Colombia and Ecuador. Preliminary phylogenetic studies show strong biogeographic components affecting the distribution and isolation of different taxa within *Scaphosepalum* (Endara, Williams & Whitten 2011). Some species seem to have wide ranges like *Scaphosepalum brev*e (Rchb.f.) Rolfe or *Scaphosepalum svertifolium* (Rchb.f.) Rolfe while others seem to be endemic to certain areas like *Scaphosepalum dodsonii* Luer, *S. hirzii* Luer, or *S. ursinum* Luer (Luer 1988, Endara et al. 2011). The most recent phylogenetic study that includes *Scaphosepalum* suggests that the genus is related to *Teagueia* and close to *Platystele* (Karremans et al. 2016).

The north-west of Carchi province is one of the areas with high species diversity in Ecuador, where at least six species occur: *Scaphosepalum decorum* Luer & Escobar, *S. cimex* Luer & Hirtz, *S. ophidion* Luer, *S. reptans* Luer & Hirtz, *S. svertifolium* and *S. ursinum* Luer (Luer 1988, 2009). A conspicuous new species of *Scaphosepalum*, found in the same area, close to Maldonado in Carchi, is described here.

*Scaphosepalum ziegleri*ae Baquero, sp. nov. (Fig. 1, 2B, 3A–D).

**Type:** Ecuador, Carchi, El Carmen – Chical road, 0°54’42.5”N 78°12’48.7”W, 1755 m, collected by Luis Baquero on 15 March 2016, LB 3026 (holotype, QCNE).

**Diagnosis:** Species with large plants and long, thin petiolate leaves, vegetatively similar to *Scaphosepalum beluosum* Luer from which it differs by the dark green, subplicate leaves instead of conduplicate, light green to green, a caudate apex of the leaf instead of subacute, the flexuous inflorescence with conspicuous acuminate bracts instead of non-flexuous with thin, tubular floral bracts, the ovary smooth instead of subacute, the tails of the synsepal fimbriate instead of ciliate-spicate, and the dark blood-red, subpandurate lip instead of green dotted with purple, subpandurate-ligulate, with lateral lobes above the middle.
Plant large, robust, epiphytic, densely caespitose, to 30 cm tall. Roots slender, 0.8 mm in diameter. Ramicauls erect, slender, 2–4 cm long, enclosed by 2–3 sheets. Leaf erect, thinly coriaceous, subplicate, long-petiolate, 20–35 cm long including the petiole 8–15 cm long, leaf apex caudate 2–3 cm long, the blade elliptical 4.0–6.5 cm wide, attenuate below into the slender, channeled petiole. Inflorescence a loose, flexuous,
successively several to many-flowered raceme from low on the ramicaul, 12–20 cm long, each flower borne by a slender, faintly verrucose, horizontal peduncule 11–18 cm long; floral bracts thin, conspicuous, longer than the pedicel, conduplicate, acuminate, 9 mm long; pedicel 3–5 mm long, ovary ribbed, 5 mm long. **Sepals** waxy yellow, spotted with reddish brown to blood-red, ciliated margins, with dentate carinae, the middle sepal tricarinate, ovate and concave in the lower half, 14 × 4 mm in natural position, the apical half brownish red, narrowly tubular with revolute margins, the lateral sepals connate 10 mm into a bifid, oblong, concave lamina 6 mm unexpanded, the apical portion of each lateral sepal occupied by a thick, triangular, diverging, glabrous cushion 3.5 × 4 mm, continuous with the acute, oblique, diverging apex terminating in a decurved, fimbriate tail, the total length of each lateral sepal including the tail 16 mm long. **Petals** waxy yellow, spotted with red-brown, longitudinal callous mediately, obliquely ovate, acute, slightly reflexed at apex, 4 × 3 mm, the labellar margin obtusely angled, the upper margin slightly dilated. **Lip** dark blood-red, oblong-subpandurate, reflexed near the middle, 5.0 × 2.5 mm, the epichile obtuse, ciliate to fringed at the edge, the disc with a pair of tall, erect, serrated lamellae above the middle, the hypochile rectangular, slightly concave, the base truncate, minutely bilobulate. **Column** red, semiterete, slender, 4.5 mm, broadly winged above the middle, with a thick

foot 2.5 mm long. Pollinia 2, yellow. Fruits and seeds not observed.

Eponymy: Named after Susann Ziegler Annen, of Switzerland, important donor and promoter of Ecominga Foundation’s Dracula Reserve, Ecuador, who made it possible to purchase and protect large areas of primary forest hosting this new species and many other species.

Distribution: One population of *Scaphosepalum zieglerae* has been found growing in primary cloud forest in north-western Ecuador. Plants found in two mountain ridges, close to each other, where they
are fairly common between 1790m and 1850m of elevation, around km 7 of the Chical-El Carmen road in the province of Carchi, Ecuador.

Habitat and Ecology: Scaphosepalum zieglerae is found growing on the base of trunks of big trees in primary cloud forest at ~1800m of elevation. Large plants can be seen growing in very dark areas, where heavily filtered sunlight reaches the low understory of the forest. The dark, large leaves of S. zieglerae only compete in size with the big long-stem leaves of S. decorum. Other species of Scaphosepalum like S. cimex, S. decorum, S. ophidion, S. reptans and S. swertiifolium were found living in sympatry with this species.

Conservation Status: The population of Scaphosepalum zieglerae is under protection of the Ecominga Foundation at the Dracula Reserve, close to the Cerro Colorado sector. Extensive exploration has been done around the area by the team of orchid specialists from Ecominga for almost a decade and no other populations have been found. The Blanco river and the almost vertical walls of the Pailon ridge could act as natural barriers perhaps limiting its distribution; it is possibly more restricted than other Scaphosepalum species (S. swertiifolium, S. decorum and S. ophidion) growing sympatrically, which are found in many other localities in Carchi and around Ecuador, and also in Colombia (Luer 1988, 2009). Perhaps more research in the field and in neighboring Colombia will lead to the discovery of new populations of S. zieglerae.

Scaphosepalum zieglerae is recognized among the species of Scaphosepalum by a unique combination of characters: the large, long petiolate, dark-green leaves, the adnate leaf apex and, specially, the flowers with a unique combination of characters: the large, long petiolate, dark-green leaves, species of Scaphosepalum. Other species of Scaphosepalum like S. cimex, S. decorum, S. ophidion, S. reptans and S. swertiifolium were found living in sympathy with this species.

Acknowledgements. The author acknowledges Universidad de Las Americas (UDLA) for funding research on orchids in Ecuador. We also thank Susann Ziegler-Ann and Max Annen-Ziegler, of Switzerland, for being vital supporters and donors who helped make possible the Dracula Reserve managed by Ecominga Foundation. The Ministerio del Ambiente de Ecuador is acknowledged for issuing the Environmental Research Permit No. 008-2016-IC-FLO-DNB/MA. Also Ecominga Foundation for working in conservation of orchids in situ by preserving forests before being cut down.
